

**DECLARAÇÃO CONJUNTA sobre o  
Aproveitamento de Água da Chuva  
Dia Mundial da Água, 22 de março de 2011**

O Conselho dos Direitos Humanos da ONU afirma o direito humano à água potável.<sup>1</sup> Agora é a hora para os governos do mundo contribuírem para a fornecimento regular de água potável de maneira segura, acessível e alcançável em quantidade suficiente para mais 884 milhões de pessoas.

No Dia Mundial da Água 2011, as organizações abaixo assinadas desejam propor energicamente o uso de água da chuva: ela deve ser considerada como um importante instrumento nos esforços para minimizar os problemas relacionados com a água que já existem.

- A água da chuva é um recurso valioso que é subutilizado. Sua captação e uso podem aliviar os desafios de água potável, água não-potável, drenagem e desafios energéticos.
- Soluções locais de captação de água da chuva melhoraram a segurança da água e proporcionam importante alívio para famílias e comunidades.
- Em todo o mundo, a infiltração de águas pluviais, sua captação e armazenamento oferecem benefícios para o meio ambiente, a fauna, seres humanos e melhoram a disponibilidade de água para a indústria e a agricultura.
- É tempo de a captação de águas da chuva ser incluída nos planos de desenvolvimento de todas as agências governamentais, como parte de suas estratégias de manejo de seus recursos hídricos integrados.
- A introdução do conceito de manejo de água de chuva - a maximização dos benefícios da chuva como um recurso vital e minimizando os riscos potenciais de enchentes – nos currículos das escolas técnicas e das universidades trará benefícios futuros para o novo planejamento urbano e projetos arquitetônicos e agrícolas.

**JOINT RAINWATER HARVESTING  
STATEMENT  
World Water Day, 22th of March, 2011**

The UN Human Rights Council affirms the human right to safe drinking water.<sup>1</sup> Now is the time for the world's governments to contribute to the provision of a regular supply of safe, accessible and affordable drinking water in sufficient quantity for 884 million more people. On World Water Day 2011, the undersigned organizations wish to strongly advocate for the use of rainwater: it must be considered as an important tool in efforts to minimize the water related problems that already exist.

- Rainwater is a valuable resource that is underutilized. Its capture and use can alleviate challenges related to potable, non-potable, storm water and energy.
- Local rainwater harvesting solutions enhance water security and provide important relief to households and communities.
- All around the world, rainwater infiltration, collection and storage offers benefits for the environment, wildlife and humans, and improves water availability for industry and agriculture.
- It is time for rainwater catchment to be included in the development plans of all governmental agencies as part of their integrated water resource management strategies.
- Introduction of the concept of rainwater management – maximizing rain's benefits as a vital resource while minimizing potential rain hazards – to curricula of technical schools and universities will bring future benefits to urban planning, architectural and agricultural projects
